CONCATENATE Creator ? X

Select cells to create concatenate formula:  
\$A\$2:\$C\$2

OK Cancel

Use the separator for the delimiter (the bar) and performing the complex logic to extract the substring and add it to an array. Note two changes: First of all, the custom function can now be changed in the custom function editor and secondly, the small icon that appears next to the custom function name in the formula formation shaft will not display the...  
then groupbonus = 1 Allchic groupflowcount; If {orders.order quantity} > 5000, then ReportBonus = ReportBonus + 1 Allchic Report MarkallUpcount; = Reportflowcount + 1; If {orders.order quantity} > 5000 then goodcustomer = (customer, Customer name) All these if the instructions will be evaluated and the resulting variables will be set. You simply need to enter a group/subtotal group and a general report of the formula report to calculate the group and report the totals. Warning, you can use this function unintentionally. If any errors occur (perhaps there are duplicate objects in the crystal repository 10), a different icon will appear next to the object. Or if you create a formula with formula, custom functions was created in the current report will appear in the category of custom function of the tree of the function. The next illustration shows the same relationship using the formulas to concatenate the IL Fields together. It is actually created a group selection formula inadvertently and don't even know it. And you can also simply drag the custom function name from the category of custom functions of the report of the Formula Workshop category in the category of custom repository functions (fall to any element in the category). It is said that these formulas are calculated in different report passages with respect to the passage that actually forms the report. I have this information in the partnumber xref details I need this as the string a b c, a d b, c, d and then start a new string when it comes to a new part number. If you deselect this box, you will receive the custom function in the formula editor function tree, but not in the list of customized functions available when using the formula expert. In both cases, you want to make sure you use it before you preview the report. Using these special integrated functions, you can create formulas that make your relationships more intuitive and easy to read. However, if you are connected to a large SQL database with potentially millions of records, the...  
in the group header of a group with the group header repetition on each new option activated page (this can be set when creating or edit a group a b c ~ to see chapter 3) continues - appears only when the group header is repeated. As a general reporting rule, yes Always have the database server perform the selection of records through the aforementioned home where possible. If you want to perform several comparisons like comparisons, you can add more criteria to a list. Add SQL commands based on repositories and business views on your yours from the database exploration, the Set positioning dialog or other data dialog box generally used to add database tables to the report. Does anyone know how to do this? Total Running is accumulating orders as the report progresses. It will therefore appear in the section of the database expert repository. Click OK when the Total field creation dialog box has been completed. Otherwise, the formula returns a comma, a space, and therefore the name of the region. The process is identical in all situations. Set the formula to use "default values for null" or manage it as {demographics.lastname} & ", " & {demographics.firstname} & " (if it is null {demographics.middleinitial} or taft {demographics.middleinitial}) = "" Then "else else {demographics.middleinitial}) Page 2 Error must be a registered forum member to publish in this forum. In this example, the case instruction that corresponds to the topic exceeded return a string value to the caller ), 0) + "days" This is an example of a compound or nested declaration if you are comparing numbers, the field must be larger numerically. Furthermore, it is possible to include only numbers, Numbers and the underlining character in the name of the custom function a b c ~. Special characters (like i Signs or # The signs cannot be included. Click OK when you specified all the information to add the object to the repository. For example, if you want to combine the two tests mentioned above, the formula will start as follows: If {Customer.Country} = "Use" and {orders.Order amount} > 5000...  
example: Replace {Customer.phone}, "", "" In this case, the Replace function makes use of three parameters: The first thing is the field or value of the string you want to change, the second is the character or characters you want to search and the third is the character or characters you want to replace search characters with. For example, if you use the @shipping exception formula as the angular stone for 50 other formulas in your report, and then you decide to reduce last year's sales qualification from \$ 50,000 to \$ 35,000, you only have a formula to change On your report, not 50. If the comparison operator is chosen, it allows more items, you can add an element typed in the Multiple box by clicking Add. However, if the selected expert is not able to completely interpret the formula you created, you will see a slightly different behavior for one or more cards. It is therefore possible to view the value of the variable accumulated in the group's largest page and assign the variable an empty string in the group header to start the entire process again for the next group. If the field is exactly the same as none of them, the record will be included. Make sure you don't use a name already used for another repository object of the Type in the same folder (it will be notified if you do it and overwrite the object of the repository with the same name if you proceed). Font size Choose the font size, in points, from the drop-down list or A value directly in the box. When you release the object in its new location, it will then be displayed where you dropped it. Consequently, it is necessary to restore the total variable monthly running in each group header with the following formula: currency varies monthly; = 0 Figure 5-5: Formula in the...  
Left. The migratory wizard will show a check mark next to each object successfully copied. Choose a name within the name limitations discussed later in this chapter. If the right has already been granted or denied at a higher level (the crystal management server or a higher level folder), this right will be inherited at this lower level. If the values are the same, you know that the same customer will appear in the first record on the next page, and you can notice it with a text message. There are many integrated functions to help you use date and time fields. If you choose the option greater than or equal to the option, the field can be the same or greater than you are comparing. You can create a formula that make use of the function with the formula expert (covered in detail in chapter 5). Once you choose a color that becomes the default color for the button, you will see the small row in the Change the color button. And finally, you can simply drag the custom function you want to add to the report from the category of custom repository functions to Of custom functions of the report of the custom functions category of the formula laboratory shaft. To use the selected expert, simply click on Show Formula. If requested, access Crystal Enterprise. If you choose a database voice browsed by the drop-down list, it will be added to the Box automatically. Probably the most obvious clue that is connected an object is the incapacity to change it. And the left function, which returns a number of characters from the left side of a larger string, you need to provide two arguments: the string to retrieve a subset of characters, and the number of characters to be recovered. If you have not already logged into the Crystal Enterprise 10 system to access the repository, you will be asked to do so. The object on the report will therefore appear as it did when the relationship was last saved. Depending on the Crystal Enterprise system is connected and the rights you have been granted, you may not be able to add or update custom functions. It is therefore possible to use the variable in other...  
counting summaries or distinct (depending on how united the field you are summarized is), along with any field from the report that won the null values. But, if you have familiarity with the Crystal Reports formulas in general, you should be able to apply your knowledge existing to the creation of customized functions quite quickly. This feature is required to avoid the type of problem shown here: this problem occurs because it is possible to concatenate a numeric field on a literal string (or any other combination of non-corresponding data types). For those options that Aren T Auto-Explanatory, Crystal Reports online help will provide information. As mentioned in Chapter 3, this causes the report of the Grand disagree with the sum of all the group's totals. Search for custom functions basic syntax or The crystal syntax works. If the formula is already evaluating in that step, you can create a summary or total total on it. For example, to determine a given exactly one month before today's date, this formula is used: DataSeadd ("M", -1, Currentdate) The argument M indicates a one-month interval. Shared the variable not only remains in the purpose of the duration of the entire main report, but it can also be indicated in formulas in Subreport. The custom function of extracted from the Formula dialog box will appear, as shown in Figure 6-2. The function shaft and the operator tree adjust according to the selected syntax. The drop-down list reverses all the comparisons that you can use to select the records: It can show some varied based on the type of field chosen for the selection of records. If you like to change, rename or delete the current field running, you have these choices in the Explorer field. The Explorer repository will redisplay to show only objects in repositories that match the criteria you have typed. (The subjects are treated in chapter 13.) The following are the basic operations that can be carried out in the variable declarations (or, instead, of declaring declaration in the basic syntax, to determine the scope of the variable. An example...  
group to a literal string based on the value of the topic. In the example shown in the figure, the original formula The custom function based on two database fields: {orders.order amount} and {customer.last year s sales}. Note that an additional folder has labeled the custom functions that you may not have seen first in other versions of the repository explorer for the processing of the formula. To use the selected expert when using one of the report wizards, choose at least one table in the data section and, if necessary, connect the tables in the Connection section (link to the table is covered in more detail in the chapter 16). Only if you have a synthesis or subtotal function in the formula, the crystal reports will automatically evaluate the formula in the passage during the printing of the records (the formula then becomes a formula of the second step). As when dragging and releases the fields from the Explorer field, a side dish is displayed while dragging. The declarations within the parentheses will be carried out once for each increase in the counter variable. If you want to rename a already added folder, select the folder you want to rename, and then press and hold the mouse button on the folder for a few seconds. If you added the custom function only to a report, you can change a custom function in the same way in which a formula would change: select it in the formula workshop and...  
the reporting using a bitmap graphic object connected to repository and text objects. This probably won't affect all reports using these objects to automatically reflect changes to the repository, your logo or slogan they change date. Record selection occurs during the first report pass, before the data has been ordered or grouped. This option actually adds a currency symbol, but the symbol changes to the percentage sign and the position on the right side of the object. If a variable has a wide range, its value will be maintained for use not only in other formulas, but also in Subreport within the main report. Although this is a good example of how a bit of the cycle can cycle while a condition is true, it is a fairly complex process for relatively simple research and the replacement function running. If none of these conditions is true, a Catchall Else clause displays another string value. This is why you see the A "1 subtraction of the value returned by Instr. By placing the database fields on the report in fixed positions, the report will never be able to accommodate different widths of names, surnames, city and so on. In both cases, the change applies to all occurrences of the object on the report a b c ~, if a field is formatted in the Details section absolutely, this field will appear the same whenever printing. Then click on the or on the New button to choose the correct field from. By placing the optional keyword in front of a topic name, you specify that the formula called the function must not provide this topic. The syntax of the function is the following: Expression> , } This function can simplify the logic if they then-stretches for small and simple formulas or when you want to perform a mini si-then-else statement as part of a more...  
Large formula. Probably the null is stopping the formula FOM return anything. The repository supports five types of crystal objects: text objects Standard text objects containing static text (no built-in field) bitmaps (images) bitmap images, such as logos, photos and signatures Functions of custom functions or subroutines that can be used all...  
depending on the type of data. The synthesis and argument descriptions are interchangeable with those of the custom extraction function from the Formula dialog box. Changing the descriptions of the function and the topics in both points will change in the other. It is among you allows you to select two elements to create a comparison interval. Tip A. Several factors determine if the database will contain or less null values. StringVar Newphone = (customer.phone), While Instr (Newphone, "> ") > 0 do (newphone = left (newphone, Instr (Newphone, "> ") - 1) & RIGHT (Newphone, Length (Newphone) - Instr (Newphone, "> ")); NewPhone using Join and Split functions to avoid loop...  
SQL SQL Via ODBC, as well as certain PC style databases using a direct database driver. In both situations, you will probably see the overall performance improved if you use indexed fields for selecting the record (with PC-style databases, this is often very critical). But the divided function, like its equivalent in Visual Basic, will automatically run all this logic for you. The advanced changes display settings and filtering buttons expose new features in the repository of version 10. Page 20 When the repository was introduced for the first time in Crystal Reports 9, it was not managed within Crystal Enterprise. Or, you may want to check the number of days that a product has been brought to the shipment, in combination with the courier that has shipped the product and the sales level of the customer, to determine if an expedition has satisfied the shipping objectives of your own agency. Figure 5-8: The total execution dialog of the Start field by giving the total field running a name (If you don't like the default name provided by Crystal...  
another formula when evaluating in the same passage and are in the same section of the report. Since the Crystal reports must store the data that constitute a report somewhere, it is possible to fulfill the memory or space of the temporary disk in this situation. To improve future performance while working with the report, Crystal Reports creates a set of saved data. If you click the Advance Filter button, or right-click anywhere in the Repository Explorer and choose the Advanced Filter from the pop-up menu, the Repository Explorer will expand to show two filter text boxes And a button applies. However, many of the examples indicated above can actually be performed without even creating a formula. However, only records that include midnight end times will be included "any time of a second second after midnight for the second date is not included. If, as previously discussed, you just want to have a single set rights apply to the entire repository, you need to set only rights at this level. Tip A b Many of the types of formulas illustrated in this chapter are included in the sample reports on the accompanying website of this book. But since the assignment of the variable of the GoodCustomer is the last action you perform, the customer's name is what the formula is actually displayed on the report. Once you have created the folder structure, you can place text...  
the chosen group or user. Run the total fields are covered in this chapter. You do by changing the formula evaluation time. Character character color color. It is quite common to learn how to use some spiffy features of a tool, and then use it in excess! The variables have that potential. Click the Insert button Further information to provide optional elements, such as default topic values and other descriptive text. If you choose this operator, another drop-down list is displayed containing the crystal reports. This construct is similar to doing and while loops used in Visual Basic languages and other procedural languages. When choosing a data field in the Choose dialog box The selected expert operates the comparison of the available period. If you choose to do so, the old repository object will be replaced with the updated version. Because you are forcing this formula to evaluate after a formula that is in the second passage, there is no need to include whilePrenitor/Records in this formula. Page 7 The Crystal Reports have been As an...  
customers, only orders made in 2001 or only invoices that are more than 30 days passed. When reading the records occur when the records are read from the database, but before performing any selection, sorting or grouping of the record. Do this by clicking the Preview button in the Edit Row dialog box toolbar. Alternatively, you can use the formula expert to create a formula based on a customized function from the repository. The indexed fields are fields that are specially designated when the database was designed. In this situation, it is necessary to use the built-in time function to return only the portion of a field time. TIP It is important to remember that the case of the position of the placeholder is significant. This variance is because the custom functions are designed to be independent of any particular relationship they are inserted: It is not possible to include database fields in a custom function a b c ~, "there would be no way to ensure that these fields would be available when the function is called from another report. Be aware, though, what these objects now they will behave as if you have just added them to the report a b c ~, "who have now to be automatically updated by the repository. You can also make the choice with the appropriate check box on file report options. IF-THEN-Allique The formulas are created with the following syntax: if then If true= otherwise...  
The test part of an IF-Then-stretch formula must use the comparison operators found in the operator shaft box (or a Boolean formula, discussed later in the chapter). To declare a variable, type the variable declaration followed followed The name of the variable, as this example: number of Bonusamount NumberVar; This declares a numerical variable called Bonusamount which can be assigned a numeric value. The steps to add a custom function to a report are: 1. Select the formula editor. 2. Click on the Add button to add a new custom function to the report. 3. Click on the Edit field object from the menu. 4. Edit the field object from the menu. 5. Click on the Add button to add a new custom function to the report. 6. Click on the Add button to add a new custom function to the report. 7. Click on the Add button to add a new custom function to the report. 8. Click on the Add button to add a new custom function to the report. 9. Click on the Add button to add a new custom function to the report. 10. Click on the Add button to add a new custom function to the report. 419. Click on the Add button to add a new custom function to the report. 420. Click on the Add button

database field below), you will use the selection of the group instead of Record selection. Do not forget that the selection of a summary or a subtotal in the selected expert will create a group selection formula instead of a record selection formula. If you want to create a group or a user where you have previously set the rights to, select the user or group and click the Delete toolbar button (the X). Note â the ampersand concatenation operator Available in both crystal and basic syntax. Save the object in the repository in the same folder and with the same name as the original object. Select the object, hold the mouse button for a few seconds a a The object in modification mode and change. Select Case is very similar to its Visual Basic counterpart. Most modern PC and SQL databases support some or all these types of data. For example, the formula 25 + 7 + 100 returns a numerical result of 132. Here is an example of crystalline syntax to assign a variable a value to a separate line: WhilemplatationRecords; Personalized numbervar; Persercount: = Persercount + 1 Here, the CustomerCount variable is declared on the first line (finished with a semicolon) and assigned to the second line. Similar procedures will add SQL commands and corporate views on the report from the repository to other data dialogs. You can use something similar to the following: if it is not inepeatogroupheder, groupboonus: = 0 Page 4 Many advanced users (especially those with programming backgrounds) will often find some of the procedural capacities of high-level computer languages useful when Design reports. This formula compares the field in the next record at the same field in the current record. It is as if you can search for partial text matches using wildcard to search for records that contain special characters or groups. Other functions available in running totals are the same as those available for summaries. Although there is no way to change the group tree in this situation, it is possible to correct the total problem using the totals running instead of large totals. If, for example, you want to track a customer name from the record to record and the customer name field in the database is a string data type, you need to declare a string variable to contain the information. Clicking the Text Help button will simply see another dialog box which you can type the text of the free module that describes the custom function, providing more details on its topics or return value or other useful information. And, he doesn't take a mathematical degree to see him see him The great totals are not added. In other words, if you ask to see the registers in which the country is used, a record will be returned if the database field contains mixed characters, such as the United States? The dazzling exception, however, is when a formula uses variables. You must also give each variable a name. Choose disconnects from the repository from the pop-up menu. Contrast that with this formula: "25" + "7" + "100" or "25" and "7" and "100" which returns a string result of 257100. Decimal decrease decrease the number of decimal seats displayed. Once this operation has been done, all custom functions has been added by the repository, now will appear in the custom functions of the function tree to be added to the formulas. However, it may be necessary to use it with formulas that contain variables. You can use the Boolean formula in the selection of the advanced record (covered in chapter 8) and conditional formatting (covered in chapter 9) to limit the report to certain records or to have certain objects on the report appear with a different formatting. Then, click the Folder button in the Explorer Repository toolbar or on the right mouse button on and select New folder from the pop-up menu. If the test fails (returns false), a different result will be returned. If you click on the arrow in the drop-down list, the selected expert will navigate the database and will list some sample elements from that database field. Then, if Tordi returns thirty and XX / 100, you want to extract the first six characters from the left (until they are found). All these are applications for a formula that manipulates or creates string data. This will display the Default Values dialog box. Consider the following example. Choose the appropriate item from the drop-down list. Look Functions or online help for Datetimevalue, Timevalue, Isdatetime and Isstime. Thus, this formula appears with the small x s on the Design tab (if the field names show are deactivated â c
